

RCOphth Annual Congress 2018

Intraocular haemorrhage: a bloody challenging situation

Tuesday 22 May 2018 15.30 – 17.30

Chaired by Mr David Steel, Sunderland Eye Infirmary

Intraocular haemorrhage can complicate a number of situations and raise several key questions in terms of optimum clinical management. This symposium will be delivered in 6 presentations. The first two talks will provide Ophthalmologists with an overview of conditions and medications that predispose to intraocular haemorrhage, including the newer agents that are increasingly being used and their perioperative management. The final four talks will cover the main types of intraocular haemorrhage encountered in routine practice namely anterior segment hyphaema, vitreous haemorrhage, choroidal haemorrhage and subretinal haemorrhage. The aetiology and acute and chronic management will be discussed. The emphasis will be on practical decision making whilst also reviewing key background knowledge. At the end of each talk case scenarios will be presented and discussed with active audience voting and participation.
